Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ALIGNMENTS

Query Match Best Local (Use of YKL-40 and anti-YKL-40 antibodies - for developing prods. for diagnosis prognosis and therapy of diseases involving connective tissue degradation.

Disclosure; Page 66-67; 88pp; English.

YKL-40 (40 KDa) was purified from human osteosarcoma MG63 cells.

The N-terminal sequence is shown in R70745; the full coding region of the YKL-40 gene is given in Q8245. Homology of the N-terminal and 2 internal peptides (R70746-47) with a bacterial polysaccharide hydrolase suggests that YKL-40 degrades polysaccharide components of connective tissue. YKL-40 is a marker of e.g. metastatic breast cancer and inflammatory or degenerative joint diseases.

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodn. of the protein, opt. after being mutated to produce MPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-114,952). The protein has a mol wt. of 115 kD (calculated Mr-114,952). The protein has a mol wt. of 115 kD (calculated Mr-114,952). The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Natriuretic protein receptor B - for diagnosis and treatment of kidney failure, heart failure, hyperaldosteronism, glaucoma etc. Claim 3; Fig 1; 49pp; English.

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodn. of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-114,952). The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can

E.coli beta-galactosidase. The wild type sequence was obtained as single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are completed to forms that can amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of wh
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             EP-285123-A.

                                                                                                                                                                oligonucleotide probe MK14-A consists of nucleotides 5-95 of (051735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PT Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins PT comprising a binding domain and an effector domain PS Disclosure; page 35; 255pp; English.

CC 070468 is a generic DNA sequence used to generate random TSAR (Totally CC Synthetic Affinity Reagents) peptides. This generic formula can also be CC represented as follows: x(NB)11(TGC)(NNB)5Z(NNB)7(TGC)(NNB)10Y: x CC and Y are flanking restriction sites (X is not the same as Y) that are CC not specified further. Other generic sequences are shown in Q70466-68.

CC Other specified further. Other generic sequences are shown in CC comprising at least two functional regions - a binding domain with CC affinity for a ligand and a second effector peptide portion that is CC chemically or biologically active. They may further comprise a linker CC peptide between the 2 domains. The oligonucleotides are also designed so CC that the expressed peptide contains 2 or 4 cysteine residues positioned CC in, or flanking, the unpredicted or variant residues. These residues confers some degree of conformational rigidity to the peptides. The TSARs CC compsns. comprising a TSAR binding domain can be used in vivo to CC deliver a chemically or biologically active moiety, eg. metal ion, CC cell. They can also replace the function of macromoleules, eg.

CC monoclonal or polyclonal antibodies and therefore circumvent the need CC cell. They can also replace the function of macromoleules, eg.

CC monoclonal or polyclonal antibodies and therefore circumvent the need CC callowing direct and rapid detection in a screening process.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PT Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins proteins or peptides and an effector domain proteins processing a binding domain and an effector domain proteins are comprising a generic DNA sequence used to generate random TSAR (Totally CS ynthetic Affinity Reagents) peptides. This generic formula can also be crepresented as follows: X(NNB)16(TGC)(NNB)12(NNB)16(TGC)(NNB)11 X X CC and Y are flanking restriction sites (X is not the same as Y) that are contained the terofunctional proteins or peptides other specific peptides generic sequences are shown in Q70466-68. CC comprising at least two functional regions - a binding domain with CC comprising at least two functional regions - a binding domain with CC comprising at least two functional regions - a binding domain with CC comprising at least two functional regions - a binding domain with CC comprising at least two functional regions - a binding domain with CC comprising at least two functional regions - a binding domain that is CC peptide between the 2 domains. They may further comprise a linker CC peptide between the 2 domains. The oligonucleotides are also designed so CC that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs CC comprise a chemically or biologically active moiety, eg. metal ion, cc deliver a chemically or biologically active moiety, eg. metal ion, cc call. They can also replace the function of macromolecules, eg. cc complex methods of hybridoma formation or in vivo antibody production. CC complex methods of hybridoma formation or in vivo antibody production. CC complex methods of hybridoma formation and activity allowing CC direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC Q70469 is a generic DNA sequence used to generate random TSAR peptide CC Q70469 is a generic formula can be represented as follows: X(TGC)(NNB)10-CC (TGC)(NNB)2(TGC)(NNB)14(TGC)X: X and Y are flanking restriction CC sites (X is not the same as Y) that are not specified further. This CC sequence generates peptides that are cloverleaf in structure. Other CC generated by these generic sequences are shown in Q70465-68. Other specific peptides CC generated by these generic sequences are shown in R65150-54. TSARs are CC concatenated heterofunctional proteins or peptides, comprising at least CC two functional regions - a binding domain with affinity for a ligand and CC a second effector peptide portion that is chemically or biologically CC active. They may further comprise a linker peptide between the 2 domains. CC The oligonucleotides are also designed so that the expressed peptide CC contains 2 or 4 cysteine residues. These residues confer some degree of CC conformational rigidity to the peptides. The TSARs or compsis. comprising CC a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma or in vivo annihologue of hybridoma are easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

Random point mutations were introduced into the alpha fragment of E. coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                LT 15

New DNA encoding an oviduct-specific glycoprotein - useful process of the production in high quantities.

Claim 4; Pages 11-14; 22pp; Japanese.

Q90443 encodes R73992 murine oviduct specific glycoprotein The cDNA can be used for the commercial recombinant prodn.

MOGP in high quantities.

New plant protein having endo-chitinase activity - used in antifungal compsns. and to develop transformed plants which are less susceptible to fungal infection.
Claim 3: Page 19-20; 43pp; English.
Screening of a lambda ZAP cDNA library of TMV-infected Samsunn NN tobacco plants with a probe derived from PROB40 (a partial Cluster-A cDNA clone) resulted in the isolated of 11 positively hybridising clones. Analysis revealed that all were identical and corresp. to Cluster-A cDNA. The nt sequence of clone cA-3 is given in Q82973/R70025. This clone lacks 7 codons of the 5' part of the ORF. The cDNA clone was completed by performing a PCR reaction on clone cA-3 with primer T7 (082794) and primer P1 (Q82975). A partial AA sequence of the protein isolated from TMV-infected tobacco leaves
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polypeptide and DNA encoding it - related to protective mechanisms such as immune response etc. Disclosure; p; Japanese.
This polypeptide is involved in protective mechanisms such as response, cell growth and activation of protective functions. Sequence 321 AA;
                                                                                                                                                                                                                                                                                                                                                                         Apotheker-de Groot M,

New plant protein having endo-chitinase activity - used in antifungal compans. and to develop transformed plants which are less susceptible to fungal infection.

I less susceptible to fungal infection.

Screening of a lambda ZAP cDNA library of TMV-infected Samsunn NN tobacco plants with a probe derived from PROB40 (a partial Cluster-A cDNA clone) resulted in the isolated of 11 positively hybridising clones. Analysis revealed that all were identical and corresp. to clones. Analysis revealed that all were identical and corresp. to clones. Analysis revealed that all were identical and corresp. to clones. Analysis revealed that all were identical and corresp. to clones. Analysis revealed that all were identical and corresp. to clones. Analysis revealed that all were identical and corresp. to clones. Analysis revealed that all were identical and corresp. to clones. Analysis revealed that all were identical and corresp. to closes. Analysis revealed that all were identical and corresp. to clones. Analysis revealed that all were identical and corresp. to clones. Analysis revealed that all were identical and corresp. to clones. Analysis revealed that all were identical and corresp. to clones. Analysis revealed that all were identical and corresp. to clones. Analysis revealed that all were identical and corresp. to clones. Analysis revealed that all were identical and corresp. to clone ca. 3 is given in 082973/CC R70025. A genomic library of N. tabacum was screened using the cluster-A cDNA including the deduced primary structure of the Cluster-A cDNA including the deduced of the cDNA complete int. sequence of Cluster-A cDNA including the deduced of the cDNA complete int. sequence of Cluster-A cDNA including the deduced of the cDNA complete int. sequence of Cluster-A cDNA including the deduced complete int. sequence of Cluster-A cDNA including the deduced complete int. sequence of Cluster-A cDNA including the deduced complete int. sequence of cluster-A cDNA including the deduced complete int. sequence of cluster-A cDNA i

Such DNA can be coupled to sequence of interest, e.g. one coding for enzymes which confer resistance to pathogens (esp. endochitinases). Plant calli which have been successfully transformed by the sequences are selected by their ability to grow on oxalic acid-contg. medium. R56861 is a known sequence of a mature endochitinase; the sequence was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cell selection, esp. gene coupled to gene-encoding conferring pathogen resistance Disclosure and Claim 8; Page 39-40; 64pp; French.

                                                                                                                                                                                                                                                                                                                                                                                    mRNA by screening with anti-chitinase antiserum. Three probes were designed based on the CH3C sequence, corresponding to the start, middle and downstream regions of the coding sequence. The probes were used to isolate the full-length coding sequence of A.album endochitinase from an A.album cDNA library in PTZ19R. A 1.6kb fragment was identified in serval positive clones. The sequence of the fragment contained an ORF encoding a 423 amino acid protein. The mature endochitinase can be used to control pathogens

Chitin biosynthetic enzymes end I, exo I and exo II - are periplasmic chito; dextrinase(s), periplasmic beta-GlcNAcidase(s) and aryl beta-N-acetyl; sluco; amidase(s), respectively example 4; Page 79-82; 101pp; English. Periplasmic chitodextrinase (W02156), periplasmic Periplasmic chitodextrinase (W02157) and aryl Beta-N-acetylglucosaminidase (W02158) can be used to produce chitin oligosaccharides with the structure (GlcNAc)n where n is 2 or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Recombinant DNA encoding fungal endo:chitinase - useful for protecting plants against fungi, insects, etc. Claim 22; Page 60-61; 75pp; French.

This mature protein from the filamentous fungus Aphanocladium album has endochitinase activity and is used to control patho;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  T 11

                                                                                                                                                                                   Plant cell conty. signal sequence of chitinase A gene - for secretion of foreign polypeptide, esp. chitinase A for protection against pathogenic fungi and nematodes. Disclosure; Fig. 1A-1C; 20pp; English. Serratia marcescens QMB1466 genomic DNA was partially digested, liquited into vector pLAFRI, packaged into lambda phage particles, and used to transfect Escherichia coll DH1 (ATCC 33849) cells. Plating on chitin medium was used to screen for chitinase activity. Clone C12 (ATCC 67152) was isolated. Its sequence is given in

Disclosure; Fig.1; 13pp; English.
Plasmid pCHIT1251 containing the chitinase-A gene (chiA), fused directly to a nos promoter, may be used to transform, via Agrobacterium sp., a crop plant. The resulting transgenic plants expressing the chitinase-A protein fragment are protected against fungi, nematodes, insects and disease agents. The protein is preferably expressed by the plant only at the site of pathogen attack, e.g. only in the root cells. The plants express the chitinase in a biologically active form.

                                                                                                                                                                                                                                             periplasmic chito:dextrinase(s), periplasmic beta-GlcNAcidase(s) aryl beta-N-acetyl:gluco:amidase(s), respectively Claim 2; Page 68-71; 101pp; English.
Periplasmic chitodextrinase (W02156), periplasmic Beta-N-acetylglucosaminidase (W02157) and aryl Beta-N-acetylglucosaminidase (W02157) and aryl Beta-N-acetylglucosaminidase (W02158) can be used to produce chit oligosaccharides with the structure (GlcNAc)n where n is 2 or higher, by contacting them with soluble chitin. The enzymes are encoded by the genes endI, exoI and exoII respectively. They are all genes involved in the catabolic pathway of chitin.
                                                                                                                                                                                                                                  Sequence

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
